Naxogin® 250

Tablets

Pharmacia
& Upjohn

Naxogin (nimorazole) is chemically: 1-(N-B-ethyl-morpholino)-5-nitroimidazole.

Microbiology - Naxogin is a chemotherapeutic agent endowed with high activity against *Trichomonas vaginalis* and other protozoa (including *Giardia intestinalis* and *Entamoeba histolytica*). It is also active on anaerobic bacteria such as *Bacteroides*.

The minimum trichomonocidal concentration ranges between 0.3 and 3 mcg/ml.

Clinical Pharmacology - Naxogin is well absorbed after oral administration. Doses of 1 g of nimorazole every 12 hours for three consecutive times have given rise to blood levels of 16 mcg/ml after 3 hours from the first administration, of 28 mcg/ml at the 25th hour and of 7.5 mcg/ml 12 hours after the last administration.

Naxogin is eliminated mainly via the kidney; the concentrations of nimorazole and its active metabolites in urine and vaginal secretion are by far higher than the trichomonocidal ones. After the administration of 1 g of Naxogin at intervals of 12 hours for three consecutive times, the concentrations in vaginal secretion, measured at the 24th, 48th and 72nd hour, resulted to be of 129 mcg/g, 95 mcg/g and 4 mcg/g respectively.

Tolerability - Systematic controls of the hematological and hematocemical parameters have not shown any noteworthy alterations in the subjects treated.

INDICATIONS - Naxogin is indicated in the treatment of infections due to *Trichomonas vaginalis*.

CONTRA-INDICATIONS - Known hypersensitivity to the product.

DOSAGE AND ADMINISTRATION - The cycle of oral treatment with Naxogin is of 2 tablets daily, one in the morning and one in the evening after meals, for 6 consecutive days.

For a rapid treatment, recent discoveries have given very good results with a 24 hour administration according to the following dosage schedule 4 tablets in the morning, 4 tablets in the evening and 4 tablets next morning after meals.
